Abstract

Due to consumers' infatuation with video, both viewing and sharing, as well as the increasing number of mobile subscribers in the world, the amount of traffic generated by mobile video on worldwide networks is rapidly increasing. *iGR* estimates that mobile video will account for over half of all mobile data traffic by 2018.

This market study overviews the drivers and challenges of mobile video and analyzes consumer behaviors regarding video, including downloading and streaming files, preferred streaming services, and typical access methods – WiFi or mobile data.

The study also forecasts the mobile video traffic from 2013 to 2018 at the global level, as well as for the following regions: North America, Latin America, Europe, Middle East and Africa, Asia-Pacific, and Japan. For each region, *iGR* forecasts the number of light, medium, heavy and extreme subscribers (usage categories which are described more fully in the report), the amount of mobile video traffic used per month by each type of subscriber, and the total mobile video traffic per month. Finally, the study forecasts the percentage of total global mobile data traffic that is generated by mobile video traffic.

Key questions addressed:

- What are the drivers of mobile video traffic?
- What are some of the limiting factors on the amount of mobile video traffic?
- How many mobile subscribers are there in each region?
- What is mobile video usage today in all regions of the world and at what rate is mobile video usage expected to grow over the forecast period?
- How does mobile video usage differ between light, medium, heavy and extreme subscribers? What types of subscribers dominate each regional market?
- What percentage of total global mobile data traffic is mobile video traffic?

Who should read this report?

- Mobile operators
- Device OEMs
- Mobile infrastructure vendors
- Mobile backhaul services and solutions providers
